In modern workplace communication platforms (like Slack, Teams, etc.), employees often hesitate

- Fear of judgment from peers or managers
- Social anxiety and lack of confidence
- Concern about professional reputation

Because of this:

- Employees avoid asking questions
- Important discussions don't happen
- Knowledge sharing is reduced
- Collaboration and innovation suffer

Objective

The primary goal is to create a platform that enhances communication by ensuring anonymity while maintaining control and safety.

- Enable anonymous communication
- Improve participation
- Increase psychological safety
- Prevent misuse with moderation
- Maintain usability and performance

- Web-based anonymous communication platform
- Allows users to send messages without revealing identity
- Supports group channels for discussions
- Designed specifically for workplace environments

System Architecture

- Frontend: React.js (User Interface)
- Backend: Node.js + Express.js
- Database: MongoDB
- Real-Time Communication: Socket.io
- Security: Identity removed before message broadcast

Survey And Analysis

Survey results show significant improvement in communication behavior and user satisfaction.

- 88% more comfortable with anonymity
- 83% asked new questions
- 86% found platform easy
- 81% would recommend

Working Flow

- User logs into the platform
- Joins a communication channel whether it is standard or anonymous
- Sends a message
- (if anonymous) Server removes user identity
- Message is broadcast anonymously

Features

Chatify provides secure, real-time anonymous communication with structured channels.

- **Anonymous group messaging**
- **Real-time chat**
- **Channel-based communication**
- **Message history storage**
- **User authentication**

Future improvements will focus on balancing anonymity with safety and expanding research scope.

- **Hybrid anonymity model**
- **AI-based moderation**
- **Multi-organization testing**
- **Long-term studies**
- **Enhanced security features**

Thank You
